Use Case & Landscape

- ❖ Goal is to help incident handlers and malware analysts.
 - ❖ Reduce knowledge and experience barriers.
 - ❖ Try to flag malicious executables, but also aid the analysis process.
- ❖ Limitation – “trojanized” programs.

- ❖ IoC and signature-based methods struggle against novel malware.
- ❖ Research methods mostly ML, classifying malware into families (comparing to existing malware).

```

Can we identify such additional calls?

Waypoint

❖ Overview

❖ **Design**

❖ **General Idea**

❖ **Building Blocks**

❖ **Representing Processes as Graphs**

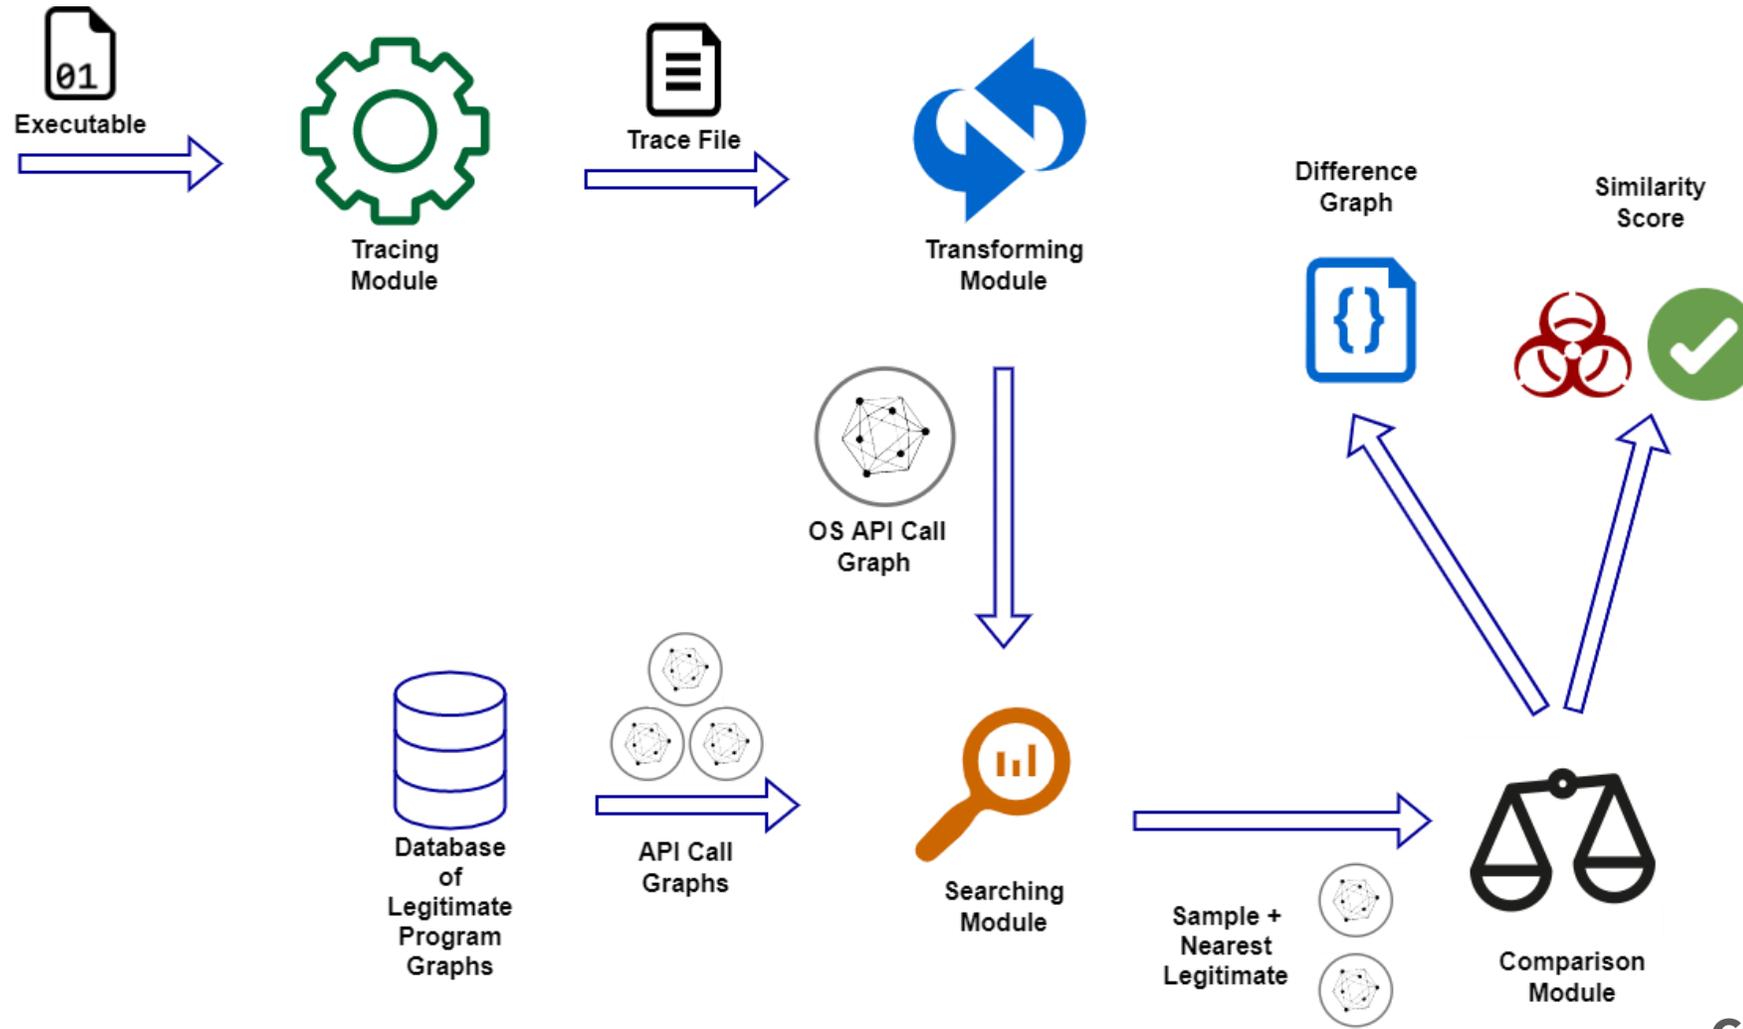

❖ **Comparison of Process Graphs**

❖ Experiments & Evaluation

The Idea

- ❖ Instead of similarity to known malware, leverage similarity to legitimate programs.
 - ❖ Possible, due to focus on “trojanized” programs.
- ❖ Novel malware should not be a problem.
- ❖ Need to take into account the dissimilarity of different legitimate versions.

Architecture

Tracing

- ❖ Gathering information about program behavior.
- ❖ We impose restrictions that the information must have some structure.

- ❖ Multiple targets available:
 - ❖ assembly, p-code(Ghidra)
 - ❖ syscalls, OS API calls

- ❖ Structure options:
 - ❖ Tainting
 - ❖ OS objects -> I/O Descriptors

Tracing

- ❖ We work with the I/O subset of the GNU libc API.
- ❖ For structure we observe which I/O descriptor the calls operate on.
- ❖ Based on the functions, we try to guess the type of the I/O descriptor (network, stream, pipe, etc.)
- ❖ <https://frida.re>

Representing behavior as graphs

- ❖ Tracing provides a sequence of calls, with the structure hidden in the call arguments. Sub-optimal for automated and manual analysis.
- ❖ Transform them into graphs, without losing details, while also “highlighting” the structure.

OS API call graphs

❖ Nodes:

- ❖ Function call
- ❖ Arguments
- ❖ General order

❖ Edges

- ❖ Encodes order for specific I/O descriptor
- ❖ Nesting

❖ Branches

- ❖ Represent functionality on one specific I/O descriptor
- ❖ Most malicious activity will have its own branch -> easy to spot

Comparing Programs

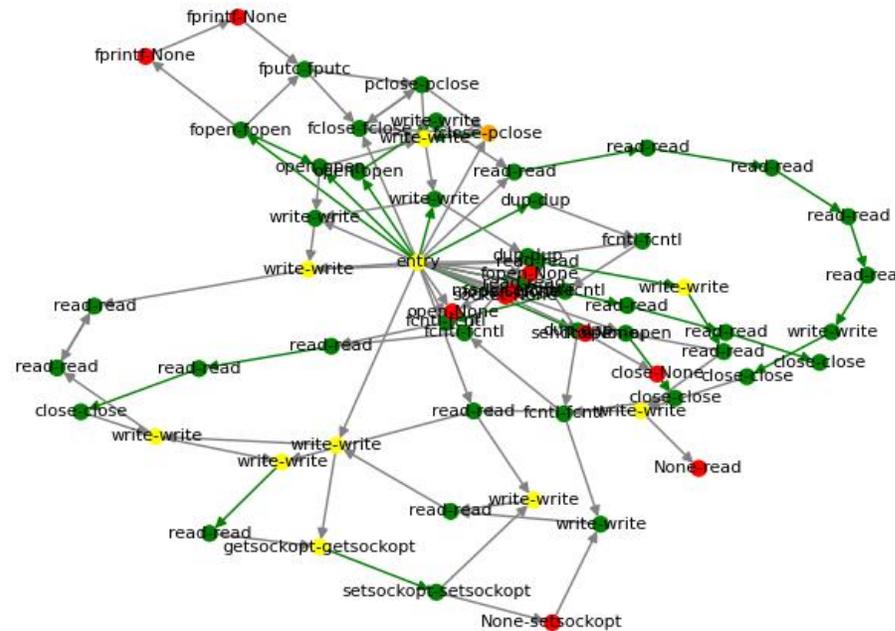

- ❖ Via their graph representation.
- ❖ Two uses:
 - ❖ Find the most similar legitimate program – heavy emphasis on speed, must not be that precise.
 - ❖ Leverage metric spaces.
 - ❖ Use well-established algorithms, with efficient approximations – Graph Edit Distance.
 - ❖ Fine-grained comparison – emphasis on precision.

Fine-grained Comparison

- ❖ Generic algorithms can not leverage the special structure and the amount of detail we have. (Also, mostly NP-hard.)
- ❖ We design a custom comparison to:
 - ❖ Indicate how much the program deviates from expected behavior. (0-100)
 - ❖ Pinpoint these deviations.
- ❖ Our algorithm is based on locality-restricted assignments.
 - ❖ Optimizations with the guessed I/O descriptor type.
 - ❖ Node comparison is customizable.

Representing Deviations

- ❖ A graph, with nodes and edges from both, the analyzed and legitimate program.
- ❖ Nodes and edges marked with new arguments describing deviations.

Waypoint

- ❖ Overview

- ❖ Design

 - ❖ General Idea

 - ❖ Building Blocks

 - ❖ Representing Processes as Graphs

 - ❖ Comparison of Process Graphs

- ❖ **Experiments & Evaluation with our PoC**

Evaluating Legitimate versions

❖ Based on the observations, 3

levels:

- ❖ 0 - 70 – definitely modified
- ❖ 70 - 90 – slightly modified, database too sparse or weird outlier
- ❖ 90 - 100 – OK

Evaluation on Malicious SSH Clients

| Malware Sample | Closest Legitimates | GED | Similarity |
|-----------------------|---------------------|-----|------------|
| Abafar_Client | ssh-6.0 | 12 | 74.370 |
| | ssh-7.2p2 | 13 | 81.606 |
| Akiva_Client_2 | ssh_debian_stretch | 82 | 54.056 |
| | ssh-6.6 | 86 | 53.958 |
| Atollon_Client_2 | ssh-7.6 | 17 | 76.236 |
| | ssh-7.9 | 21 | 58.765 |
| Bespın_Client | ssh-6.3 | 19 | 76.344 |
| | ssh_debian_bullseye | 20 | 67.825 |
| Crait_Client | ssh-6.0 | 13 | 67.044 |
| | ssh-6.1 | 13 | 69.133 |
| | ssh-7.1 | 13 | 67.027 |
| Chandriła_Client | ssh-9.0 | 46 | 36.845 |
| | ssh_debian_bookworm | 46 | 36.846 |
| Endor_Client | ssh_debian_stretch | 90 | 41.872 |
| | ssh-7.3 | 96 | 38.149 |
| Endor_Client_5 | ssh_debian_stretch | 90 | 41.872 |
| | ssh-7.3 | 96 | 38.149 |
| Mimban_Client_2 | ssh-6.4 | 12 | 68.156 |
| | ssh-6.7 | 14 | 66.100 |
| Mimban_Client_3 | ssh-6.4 | 12 | 56.527 |
| | ssh-6.0 | 20 | 64.825 |
| Onderon_Client_2 | ssh-7.1 | 10 | 63.487 |
| | ssh-6.8 | 13 | 67.732 |
| PolisMassa_Client | ssh-6.4 | 12 | 61.655 |
| | ssh-6.7 | 16 | 54.201 |
| PolisMassa_Client_2 | ssh-7.1 | 10 | 74.404 |
| | ssh-6.7 | 11 | 71.111 |
| Ebury_Injected_Client | ssh-6.8 | 20 | 80.458 |
| | ssh-ubuntu16.04 | 21 | 84.277 |
| | ssh-ubuntu18.04 | - | 85.224 |

- ❖ Samples from Eset*.
- ❖ We only use our way of finding the “original” program.
- ❖ Results deviate in the two “bad” classes, some modifications more blatant than others.

PoC evaluation Under Different Interpretations

- ❖ We shrink the database of legitimate programs (remove each with a probability of 0.3).
- ❖ Test all malicious samples and the removed legitimate ones against the “crippled” database.

PoC evaluation Under Different Interpretations

“Liberal” (0-70 bad, 70+ OK)

| | Detected | Not Detected |
|------------|----------|--------------|
| Legitimate | 1 (FP) | 14 (TN) |
| Modified | 10 (TP) | 3 (FN) |

| | |
|-----------|-------|
| Accuracy | 0.857 |
| Precision | 0.909 |
| Recall | 0.769 |

“Conservative” (0-90 bad, 90+ OK)

| | Detected | Not Detected |
|------------|----------|--------------|
| Legitimate | 6 (FP) | 9 (TN) |
| Modified | 13 (TP) | 0 (FN) |

| | |
|-----------|-------|
| Accuracy | 0.785 |
| Precision | 0.722 |
| Recall | 1.000 |

Conclusions

- ❖ Approach is viable.
- ❖ Tool alerts the analysts, graph representation of deviations is appropriate for visualization.
- ❖ Careful with the choice of tracing tools.
- ❖ Further analysis of our methods outputs?
